

The background of the slide is a composite image of space. On the right side, a large portion of the reddish-orange planet Mars is visible, showing its characteristic surface features and numerous impact craters. In the bottom left corner, the grey, cratered surface of the Moon is partially visible. The rest of the background is a dark, star-filled space with a few bright, out-of-focus stars.

# *First, There was the Vision...*

## *A Bold Vision for Space Exploration*

- ◆ Complete the International Space Station
- ◆ Safely fly the Space Shuttle until 2010
- ◆ Develop and fly the Crew Exploration Vehicle no later than 2014 (goal of 2012)
- ◆ Return to the Moon no later than 2020
- ◆ Extend human presence across the solar system and beyond
- ◆ Implement a sustained and affordable human and robotic program
- ◆ Develop supporting innovative technologies, knowledge, and infrastructures
- ◆ Promote international and commercial participation in exploration

*"It is time for America to take the next steps.*

*Today I announce a new plan to explore space and extend a human presence across our solar system. We will begin the effort quickly, using existing programs and personnel. We'll make steady progress – one mission, one voyage, one landing at a time"*

*President George W. Bush –  
January 14, 2004*

2

# Then, the ESAS Final Report...

- ◆ 1.5 Launch architecture
- ◆ Earth orbit rendezvous: CEV to LSAM/EDS
- ◆ EDS performs Earth orbit insertion & circularization and TLI burn

- ◆ LSAM DS performs LOI with CEV and lunar descent and landing
- ◆ Lunar orbit rendezvous: LSAM AS to CEV
- ◆ LOx/LH in EDS and LSAM DS
- ◆ LOx/Methane in LSAM AS and CEV

Lunar Surface Access Module

NASA's Exploration Architecture  
September, 2005

# *Followed by Dr. Griffin's Comments at 52<sup>nd</sup> AAS Annual Meeting in Houston, 11/05*

---

- ◆ “But if there were a fuel depot available on orbit, one capable of being replenished at any time, the Earth departure stage could after refueling carry significantly more payload to the Moon, maximizing the utility of the inherently expensive SDHLV for carrying high-value cargo.”
- ◆ “The architecture which we have advanced places about 150 metric tons in LEO, 25 MT on the Crew Launch Vehicle and 125 MT on the heavy-lifter. Of the total, about half will be propellant in the form of liquid oxygen and hydrogen, required for the translunar injection to the Moon.”
- ◆ “If the Earth departure stage could be refueled on-orbit, the crew and all high-value hardware could be launched using a single SDHLV, and all of this could be sent to the Moon.”

# *What Impacts Could a Depot Have...*

- ◆ **If the CaLV (Ares V) capability is retained?**
- ◆ **If the LSAM launch mass is the right value?**
- ◆ **If the LSAM landed mass is the right value?**
- ◆ **If the ESAS Recommended Architecture is “unchanged”**

Space Exploration Systems

# Analytical Path Defined by Major Options

# Architecture Can Deliver 18-75 t to Lunar Surface With LEO Depot

◆ ESAS Recommended Architecture provides 18-20 t landed mass

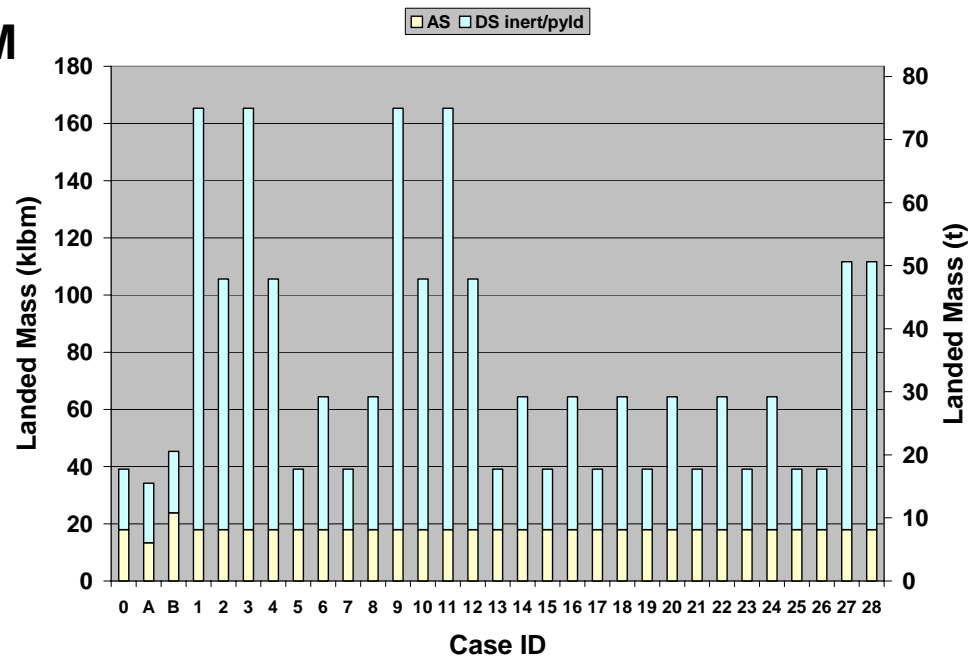

◆ Same capability with downsized LSAM and EDS with Depot

◆ 30 t capability if LOI allocated to EDS; LSAM initial mass unchanged; and EDS downsized

◆ 48 t capability if LOI allocated to EDS; EDS characteristics unchanged; and LSAM upsized

◆ 50 t capability if LOI allocated to EDS and ESAS systems unchanged

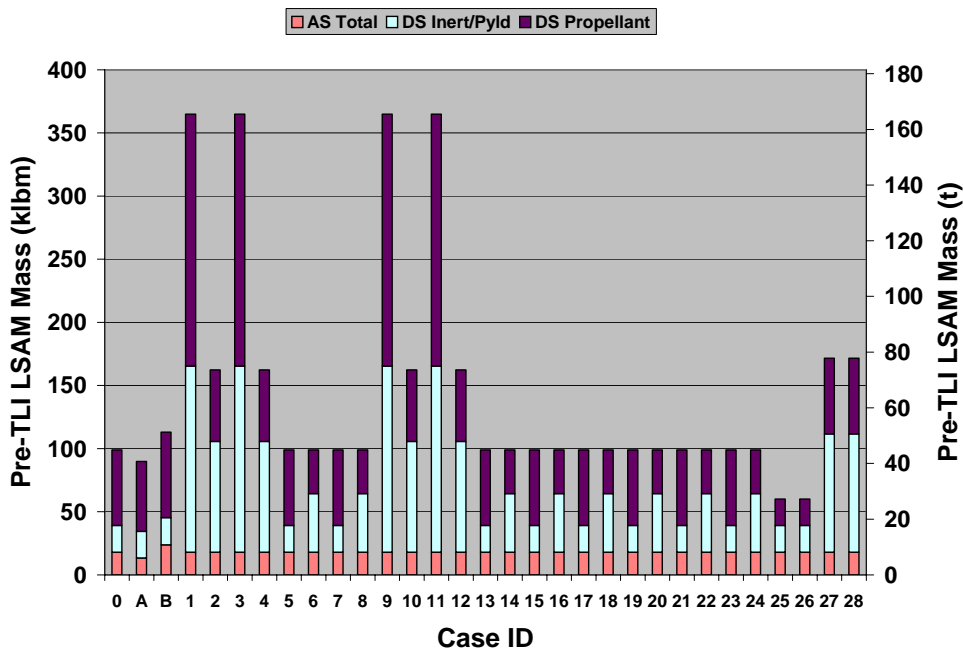

◆ 75 t capability if EDS unchanged; LSAM upsized to full EDS to TLI capability

**5 distinct capabilities to lunar surface when LEO Propellant Depot added to Exploration Architecture**

# Depot Architecture LSAM + Payload Mass Can Be 50% to 400% of ESAS LSAM

◆ ESAS LSAM mass, plus payload, is 45 t

With a LEO propellant depot, LSAM mass is. . .

- ◆ 23 t if sized for landed mass from LLO
- ◆ 75 t if EDS does TLI & LOI and EDS is unchanged

◆ 80 t if all ESAS systems unchanged; LSAM DS tanks launched empty

◆ 165 t if EDS is unchanged and does TLI only

**6 distinct LSAM configurations  
when LEO Propellant Depot  
added to Exploration Architecture**

# Propellant Depot Architecture EDS Can Be 67%, 50% or 30% of ESAS EDS

- ◆ ESAS EDS capacity is 225 t
- ◆ 100 t propellant in ESAS EDS in LEO

With a LEO propellant depot . . .

- ◆ 125 t propellant used during ascent can be replaced in LEO to deliver . . .

- 165 t to translunar trajectory
- 93-98 t to low lunar orbit

- ◆ EDS can be downsized to 180 t or 100 t to deliver 43 t to . . .

- Translunar trajectory
- Low lunar orbit

- ◆ EDS can be downsized to 130 t to deliver 23 t to low lunar orbit

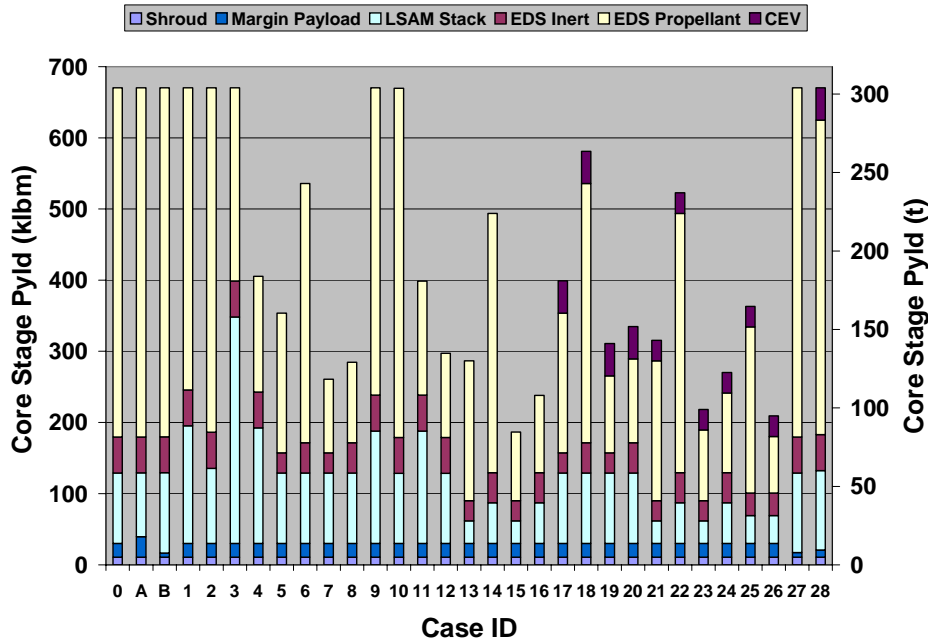

**4 distinct EDS configurations  
when LEO Propellant Depot  
added to Exploration Architecture**

# Ares V Core Stage Payload Can Be As Low As 85 t With LEO Depot in Architecture

- ◆ ESAS Architecture Ares V Core Stage Payload is 300 t

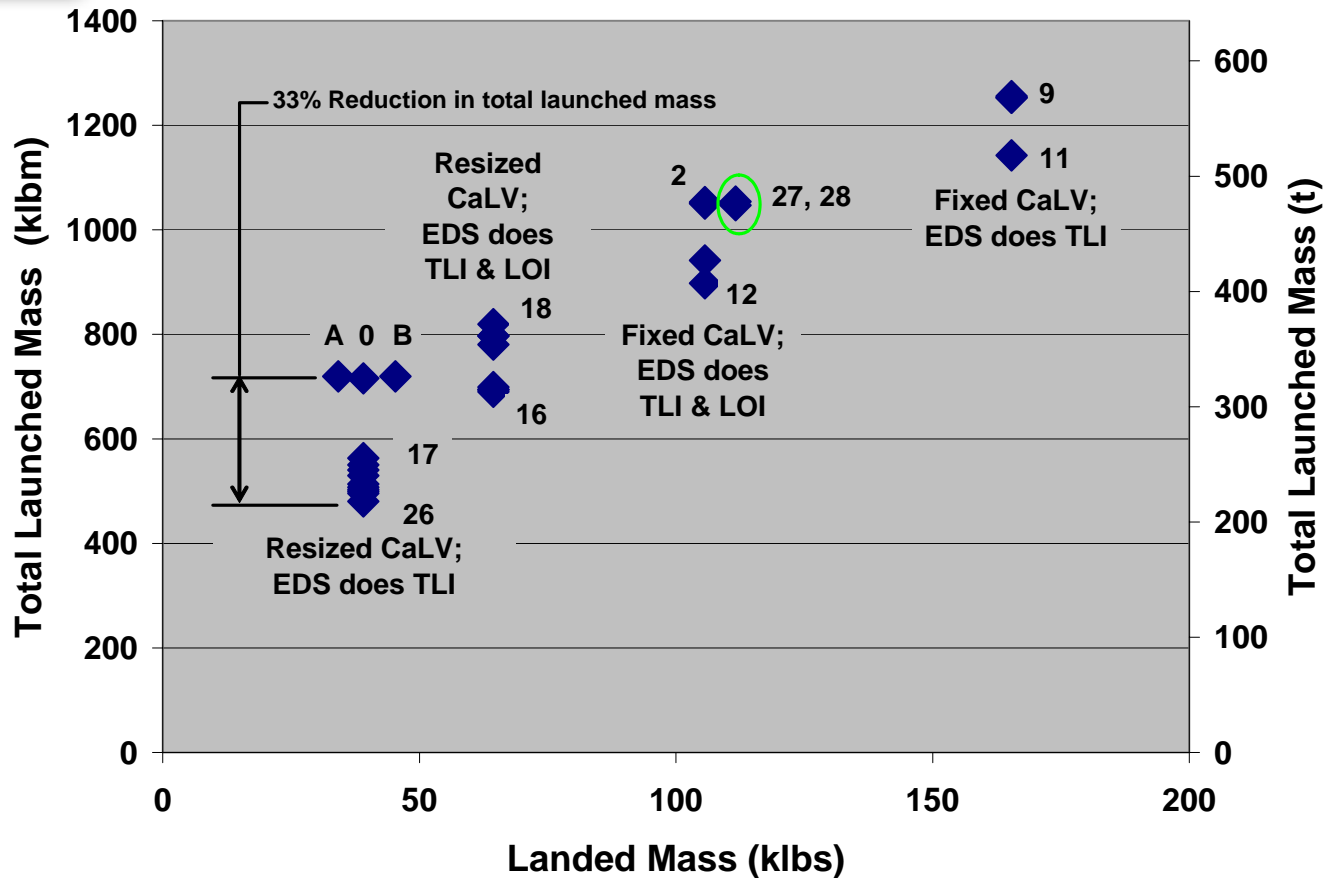

With a LEO propellant depot . . .

- ◆ 22 different heavy lift launch vehicle configurations possible
- ◆ Orion can be launched on Ares V
- ◆ Reduced Core Stage Payload options between 80 t and 265 t

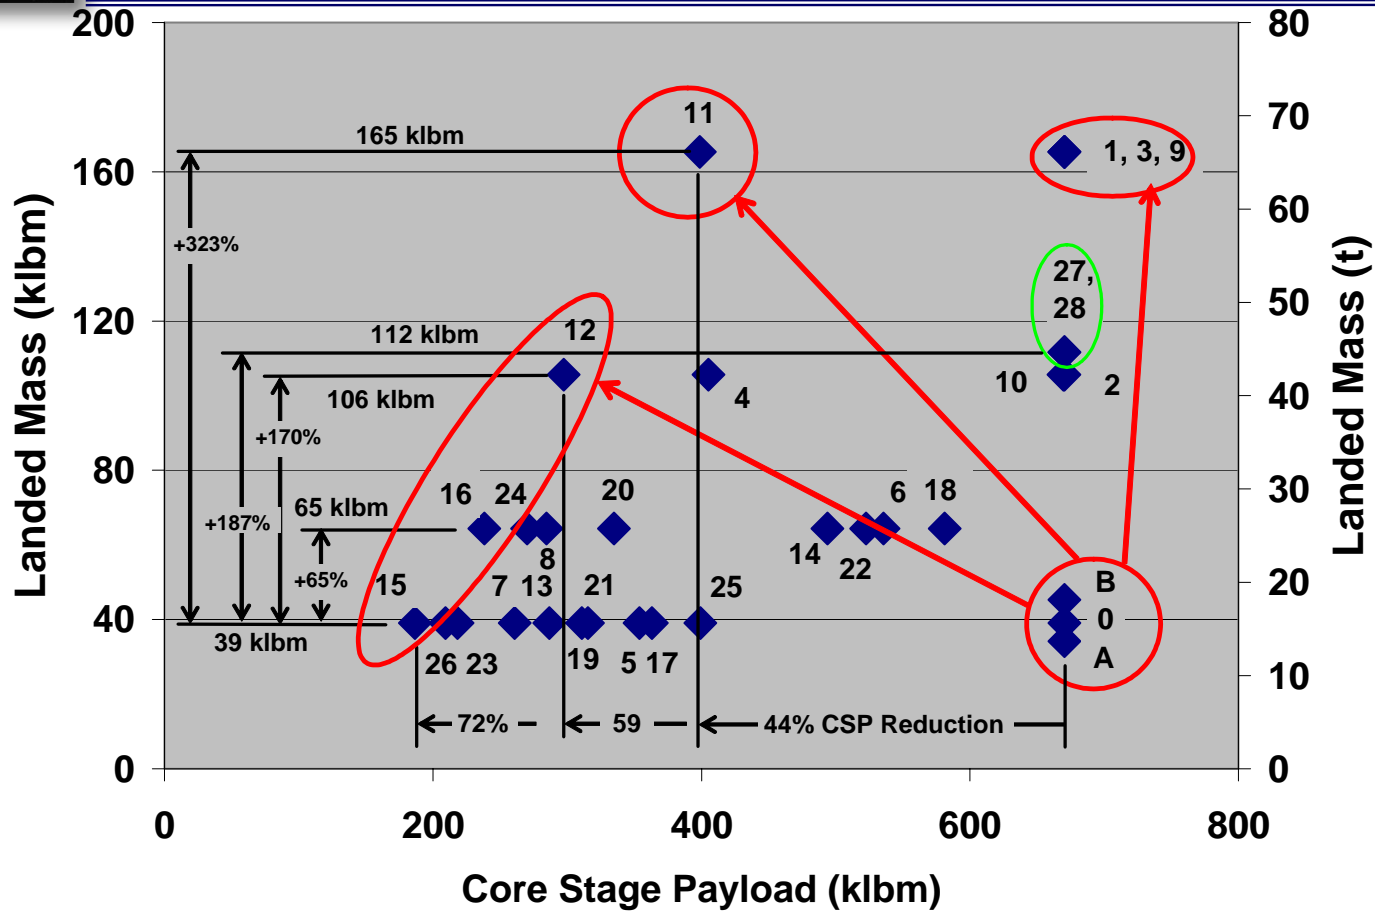

**Ares V Core Stage Payload can be reduced by 72% when LEO Propellant Depot added to Exploration Architecture**

# 67-175% of ESAS Total Launch Mass Provides 100-423% Lunar Landed Mass

**ESAS Architecture Systems with LEO Propellant Depot  
provides 200% more landed mass for 50% additional launched mass**

# LEO Propellant Depot Increases Landed Mass and/or Reduces Ares V Requirement

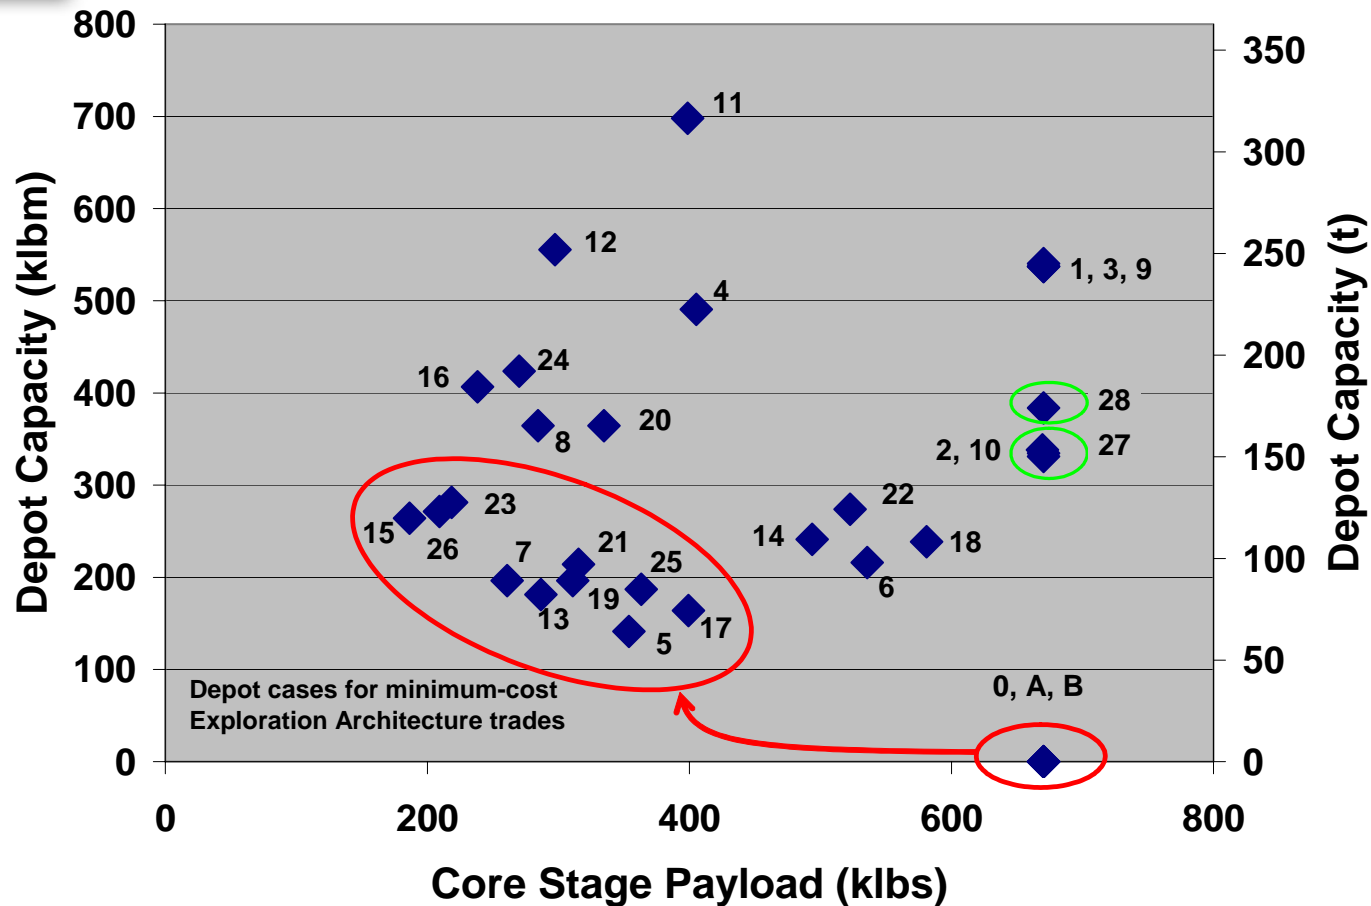

**186% increase in lunar surface delivery capability using ESAS Architecture Systems with LEO Propellant Depot**

# 64-317 t Capacity Depot Required for Various Exploration Architectures

**A propellant depot needs a 150-175 t capacity if incorporated into the ESAS Recommended Architecture**

# A 150-175 t Depot Needed to Maximize ESAS Recommended Architecture Benefits

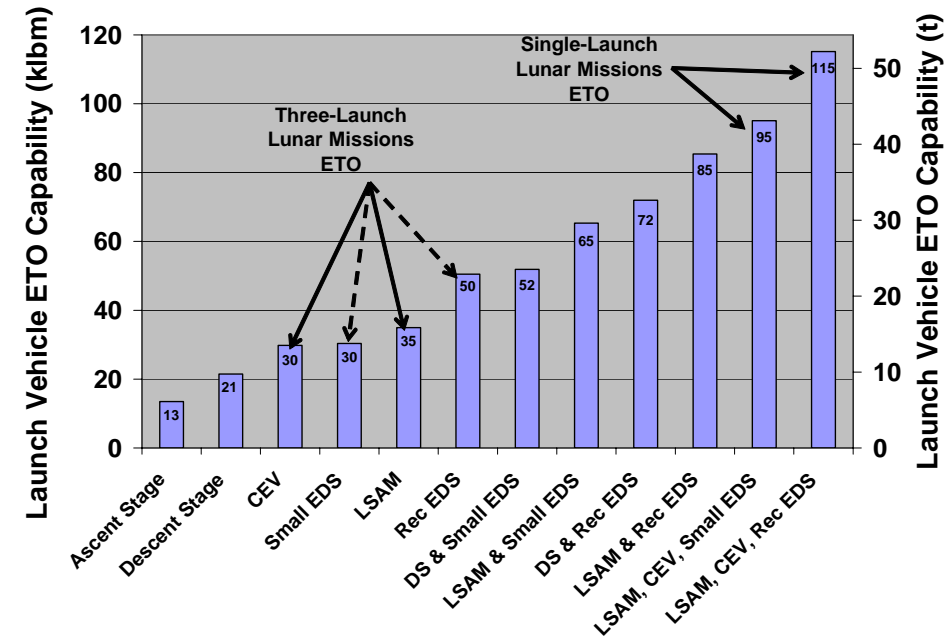

Launching Orion on Ares V instead of Ares 1 accounts for 30 t difference in depot capacity between Cases 27 and 28

# Using Detailed LSAM AS and CEV Mass Increases Landing and Depot Mass 10-15%

- ◆ ESAS Recommended Architecture updated using Chapter 4 and 5 masses
- ◆ CEV and LSAM AS mass used as quoted in ESAS Final Report
- ◆ LSAM DS mass increased to meet performance requirement
- ◆ For Cases 1-4 and 9-12, where Ares V lift capacity was held constant
  - 0.98 - 0.99 normalized landed capacity
  - 0.99-1.00 normalized propellant depot capacity
- ◆ Normalized ESAS Architecture with depot has
  - 1.03 times landed mass capacity
  - 1.00 times propellant depot capacity

# ETO Requirements Significantly Reduced If All Systems Launched Dry

- ◆ 3 LV capabilities for single element launch
  - 13 klbm – Ascent Stage
  - 21 klbm – Descent Stage
  - 30 klbm – CEV and small EDS
  
- ◆ 30-36 klbm capability if LSAM launched as a system
  
- ◆ 96-116 klbm capability for single launch
  
- ◆ 2-launch lunar mission enabled by reusable LSAM (CEV + EDS)

**Payload volume requirement and increased rendezvous and docking events are key issues associated with small ETO requirements and individual launches**

# ***ESAS Architecture Landed Mass Tripled with Addition of LEO Propellant Depot***

- ◆ **28 Depot Architectures assessed; 2 used as-defined ESAS systems**
  - **1.5 Launch ESAS Architecture (Ares I and Ares V)**
  - **1.0 Launch ESAS Architecture (Ares V only)**
  
- ◆ **51 t LSAM landed for ESAS Arch with depot (18-75 t mass range)**
  
- ◆ **670 klbm CaLV Core Stage capability (190-670 klbm range)**
  
- ◆ **150 or 175 t depot capacity required (64-317 t range)**
  
- ◆ **Depot can be introduced into architecture at any time**
  - **AR&D and propellant receiving capability required on EDS**
  - **Propellant transfer between EDS and LSAM DS required**
